

Physical Evidence Fingerprint Analysis

One final piece of evidence to investigate were the fingerprints left on Sangita Mistry's iPhone case. No two people have the same fingerprints, not even identical twins. This means that the police are able to make accurate matches between suspects and prints left at the crime scene. The four main prints that police look for are: **whorls**, **loops**, **arches** and **composite** prints.

Our evidence:

- 1) Photo of three fingerprints on the case.

2) **Fingerprint samples** from Brodie Smith, Marco Albenni, Sangita Mistry, Debbie Downes. Observe the fingerprints on the phone case. Look for the fingerprint styles to make a match.

	Right ring style	Right middle style	Right forefinger style	Match Y/N
Brodie Smith				
Marco Albenni				
Sangita Mistry				
Debbie Downes				

Whose fingerprints match those found on the iPhone case? Based on all of the evidence you've investigated, can you identify the phone thief?

-**Loops** are found in 65% of the population (Most Common)

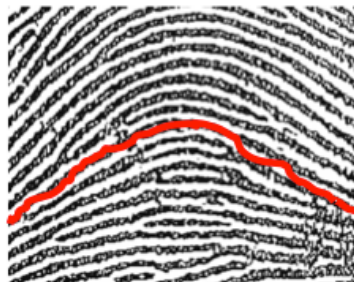

LOOP: Lines enter and exit in the same direction

-**Whorls** are found in 35% of the population

WHORL: Lines form a spiral – a bit like a whirlpool

-**Arches** are found in 5% of the population (Least Common)

ARCH: Lines enter and exit at opposite sides of the finger

COMPOSITE: A mixture of two or more separate patterns

LESSON 9: RESOURCE 2

Name: _____

Work with a partner to carefully take each other's fingerprints. Make sure you cover the fingertip in ink/ pencil lead and roll each finger from nail to nail.

Take each individual finger print and at the bottom, do the full hand print.

What patterns do you notice? Are there any accidental characteristics in the prints?
Discuss!
